MARKET INTELLIGENCE AND EXPANSION FRAMEWORK

A Systematic Process for Identifying, Evaluating, and Executing Market Expansion Opportunities on Polymarket

March 2026

Companion to: Gap Analysis Dashboard, Assessment Matrix, Strategic Recommendations

1. The Opportunity

Polymarket's platform hosts thousands of markets across politics, crypto, sports, geopolitics, finance, economy, weather, AI, and culture. Across these categories, our companion Gap Analysis identified over 50 expansion opportunities, many of which fall into three recurring patterns that a systematic framework can address:

- **Structural derivatives of existing high-volume markets.** The 2028 presidential nominee markets have generated $1.38B+ in combined volume. The logical derivative—VP nominee markets, which drove 2-5% swings in presidential odds during the 2024 cycle—represents an estimated $90-180M opportunity. Similarly, the main shutdown market has attracted $53.5M, but the closely related debt ceiling market is absent. These are natural extensions of the platform's highest-performing markets that a systematic evaluation process would surface.
- **Calendar-driven events with known schedules.** The FDA publishes 40+ PDUFA target action dates per year, each a known-date binary event with 20-50% stock price swings. SCOTUS hears approximately 60 cases per term with opinions concentrated in June. FOMC meetings occur 8 times per year on a published schedule. OPEC+ meetings, earnings seasons, and election primaries all follow predictable calendars. A forward-looking coverage plan would ensure these recurring opportunities are harvested systematically.
- **Liquidity concentration opportunities.** The 2026 midterm elections have 435 individual House race markets, each generating $0-6K in volume. The aggregate market that media and campaigns actually focus on—net seats gained or lost—would concentrate attention into a single, more liquid market. Identifying when fewer, better-designed markets outperform a larger number of thinly traded ones is a repeatable analytical decision.

This document presents a four-component framework designed to systematically identify, evaluate, and act on these types of opportunities. It builds on the analytical foundations established in the companion Gap Analysis and Assessment Matrix, which identified and scored 50+ expansion opportunities across all Polymarket categories. The framework transforms that one-time analysis into a repeatable, ongoing process.

2. Framework Overview

The Market Intelligence and Expansion Framework consists of four components, each addressing a distinct phase of the market expansion lifecycle:

Component	Function	Cadence
Coverage Calendar	Systematically harvests known-date binary events	Quarterly planning +

	across all categories	monthly updates
Candidate Evaluation Rubric	Scores any proposed market on 6 dimensions before creation	Per candidate (ad hoc)
Signal Detection Layer	Surfaces expansion opportunities from 7 structured signal sources	Continuous monitoring
Rapid Response Protocol	Decision tree for breaking events requiring same-day market creation	Event-driven

These components are sequential: the Coverage Calendar identifies known opportunities, the Signal Detection Layer surfaces emerging ones, the Evaluation Rubric scores all candidates regardless of source, and the Rapid Response Protocol handles time-sensitive events that bypass the standard evaluation cycle.

3. Component 1: Coverage Calendar

3.1 Purpose

The Coverage Calendar is a systematic, forward-looking schedule of known-date binary events that could support prediction markets. Its purpose is to eliminate the category of missed opportunity where a market could have been created months in advance but wasn't because no one was tracking the event calendar for that domain.

This component directly addresses the second opportunity type identified above: calendar-driven events. By maintaining a rolling calendar across all domains, the team can plan market creation in advance, design resolution criteria carefully, and seed liquidity before interest peaks.

3.2 Domain Calendars

Each category on Polymarket maps to one or more external event calendars. The following table identifies the primary calendars, their cadence, and the optimal market creation window—the lead time that balances early liquidity seeding against premature creation:

Domain	Calendar Source	Events/Year	Optimal Lead Time
Federal Reserve	FOMC meeting schedule (federalreserve.gov)	8 meetings + 4 SEP releases	4-6 weeks before meeting
Central Banks (Global)	ECB, BOJ, BOE, BOC, SNB published schedules	40+ decisions combined	3-4 weeks
FDA / Biotech	PDUFA calendar (fdatracker.com, pdufa.bio)	40+ PDUFA dates/year	8-12 weeks (once NDA accepted)
SCOTUS	SCOTUSblog case tracker, argument calendar	~60 cases/term, bulk opinions in June	After oral argument (2-4 months)
Elections (US)	State SOS offices, FEC filing deadlines	Primary calendar fixed 12+ months out	6-12 months for primaries
Congress	Congressional calendar, CBO scoring dates	Ongoing (session-dependent)	When legislation moves to floor
Earnings	Company IR calendars, earnings whisper sites	~2,000 S&P 500 reports/year	2-3 weeks before report date
Weather / Hurricane	NOAA seasonal outlook (May), NHC storm tracking	6-month season, ~15 named storms/yr	Season outlook: May; per-storm: at formation
Sports Awards	League award voting timelines, ceremony dates	~20 major awards across leagues	After midseason (when race narrows)

Geopolitics / Trade	WTO schedules, G7/G20 summits, USTR announcements	Variable	2-4 weeks before known events

3.3 Calendar Maintenance Process

The Coverage Calendar is not a static document. It requires quarterly planning with monthly refinement:

- **Quarterly:** At the start of each quarter, review all domain calendars and populate a rolling 6-month forward schedule. Identify the 20-30 highest-priority events and assign market creation timelines.
- **Monthly:** Update the calendar with newly announced events (FDA acceptance of new NDAs, SCOTUS granting certiorari, newly introduced legislation). Remove or defer events that have lost relevance.
- **Weekly:** Cross-check the next 4 weeks against existing markets. Flag any upcoming events that lack market coverage and route them through the Evaluation Rubric.

3.4 Example: Q2 2026 Calendar Extract

To illustrate the Coverage Calendar in practice, here is a partial extract of what a Q2 2026 calendar would contain:

Date	Event	Category	Market Exists?	Action
Apr 10	LLY Orforglipron PDUFA (oral GLP-1)	Health/Biotech	No	Create (high-profile, obesity drug)
Apr 30	CFTC ANPRM comment period closes	Regulatory	Yes (meta)	Monitor for market implications
May 6-7	FOMC Meeting	Fed	Yes	Verify Dot Plot/SEP coverage
May (TBD)	NOAA Hurricane Season Outlook	Weather	No	Create seasonal count range market
Jun (TBD)	SCOTUS June opinion dump	Legal	Partial	Create markets for unresolved cases
Jun 11-12	FOMC Meeting + SEP	Fed	Yes (rate)	Create Dot Plot market if rubric passes
Jun 14-Jul 14	2026 FIFA World Cup	Sports	Yes	Verify group stage + knockout coverage

This extract demonstrates how the calendar surfaces the Orforglipron PDUFA date (a high-profile obesity drug from Eli Lilly) and the NOAA hurricane outlook alongside routine coverage verification for existing Fed and SCOTUS markets.

4. Component 2: Candidate Evaluation Rubric

4.1 Purpose

The Evaluation Rubric is a standardized scoring framework that any team member can apply to a proposed market, regardless of whether the candidate originated from the Coverage Calendar, the Signal Detection Layer, a user request, or an ad hoc team idea. Its purpose is to impose consistent quality standards and to make the decision to create or decline a market explicit, documented, and repeatable.

4.2 The Six Dimensions

The rubric scores each candidate on six dimensions. The first four were established in the companion Assessment Matrix; the final two were identified through a second-pass review of what that initial framework missed.

Dimension 1: Regulatory Risk

Question: Does this market type face specific regulatory scrutiny that could result in enforcement action, legislative prohibition, or reputational damage?

Scoring guidance:

- **Low:** Established legal precedent or uncontested jurisdiction. Examples: political event contracts (Kalshi v. CFTC, Oct 2024), economic indicators, weather/climate.
- **Medium:** Permissible but facing active regulatory questions. Examples: biotech (insider trading), tariffs (government insider risk), aggregate sports (CFTC Advisory calls more defensible but Gambling Act could apply).
- **High:** Under direct regulatory challenge. Examples: per-game player props (CFTC Advisory flags as ‘viewed more skeptically’), in-game live markets, any sports contract if the Gambling Act passes.

Key regulatory references: CFTC Staff Advisory No. 26-08 (Mar 12, 2026), CFTC ANPRM (Mar 16, 2026, comments due Apr 30), Prediction Markets Are Gambling Act (Schiff/Curtis, Mar 2026), Arizona AG criminal charges against Kalshi (Mar 17, 2026), CFTC Enforcement Advisory on insider trading (Feb 2026).

Dimension 2: Wisdom-of-Crowds Value

Question: Does a crowd-sourced probability for this outcome produce useful informational signal beyond what already exists?

This dimension distinguishes markets that generate genuine forecasting value from markets that are purely entertainment or speculative. Both are commercially viable, but WoC-value markets attract higher-information traders, generate media citations, and provide the strongest defense against the 'just gambling' criticism.

Scoring criteria:

1. **Information dispersion:** Is relevant knowledge spread across many participants or concentrated among a few insiders?
2. **Genuine uncertainty:** Is the outcome truly uncertain, or do efficient existing markets already price it?
3. **Actionability:** Can external actors—campaigns, traders, policymakers—use the signal to make better decisions?
4. **Absence of alternatives:** Does an efficient existing mechanism already aggregate this information?

Example: A VP nominee market scores high on all four criteria: dispersed political intelligence, genuinely uncertain until announcement, actionable for campaigns and media, and no existing instrument isolates VP probability. A per-game NBA player points O/U scores low: sportsbooks already price this with professional models and deep liquidity.

Dimension 3: Estimated Attainable Volume

Question: What is the realistic volume based on comparable existing markets and traditional analogs?

Volume estimation requires a reference class:

Reference Market	Volume	Implication
Dem Nominee 2028	$922.9M	Ceiling for multi-month, high-salience political markets
Interest Rates aggregate	$538.4M	Ceiling for recurring financial event markets
Iran strikes	$127M	Ceiling for reactive geopolitical event markets
Culture aggregate	$149.1M	Ceiling for long-tail entertainment markets
Best AI model (monthly)	$9M	Benchmark for recurring tech/ranking markets
SCOTUS tariff ruling	$9M (cross-platform)	Benchmark for single high-profile legal outcome
Elon tweet count (weekly)	$6-8M per window	Benchmark for quantified social media markets

Individual House race	$0-6K	Floor for thin, low-salience political markets

Cannibalization qualifier: Distinguish additive volume (new users or new activity) from redistributed volume (existing traders splitting attention). VP nominee markets are likely additive—they reinforce engagement with the larger presidential race. A 436th individual House race is redistributive—it fragments existing midterm liquidity.

Dimension 4: Implementation Effort

Question: How much operational work is required to create, monitor, and resolve this market?

- **Low:** Single authoritative resolution URL (FDA.gov, certified election results, Freddie Mac PMMS). Existing templates.
- **Medium:** Multiple sources, data provider relationships, or new tracking infrastructure (e.g., Truth Social post counter).
- **Hard:** New partnerships (sports league data-sharing), regulatory pre-clearance, or technically complex infrastructure (real-time in-game resolution).

Dimension 5: Resolution Source Quality (New)

Question: How clean, authoritative, and unambiguous is the resolution mechanism?

This dimension was absent from the initial Assessment Matrix. Resolution quality is arguably the single most important operational risk factor. The Titan submersible incident—where a dispute erupted over whether debris counted as the submarine being 'found'—demonstrated how poor resolution criteria can damage platform credibility.

Scoring criteria:

- **Authoritative:** Does the source have official, uncontested authority? FDA.gov, certified state election results, and NOAA are authoritative. A newspaper report or social media post is not.
- **Unambiguous:** Does the criterion admit only one interpretation? The test: could two reasonable people disagree about whether it has been met?
- **Timely:** Is resolution data available within a reasonable window after the event?
- **Revision-resistant:** Is the data subject to meaningful retroactive revision? Initial jobs reports are routinely revised by 50-100K.

Example: An FDA PDUFA market scores maximally: FDA posts approval letters on FDA.gov on decision day, the outcome is binary, there is no revision process, and data is available within hours. A 'consumer confidence' market scores lower: preliminary and final readings differ, methodology changes occur, and resolution must specify which release matters.

Dimension 6: Audience Expansion Potential (New)

Question: Does this market primarily attract existing Polymarket users or genuinely new user segments?

New-user markets have compounding value: users acquired through one category discover and trade in others.

- **Low:** Existing demographics (crypto-native traders, political junkies). Another altcoin or NFL game falls here.
- **Medium:** Adjacent audience with partial overlap. SCOTUS markets attract politically engaged lawyers; some are already on Polymarket.
- **High:** Genuinely new segment. Health & Biotech brings biotech traders and pharma investors. Real estate markets aimed at homebuyers reach a mainstream audience outside the crypto-native base.

4.3 Scoring Template

The following template can be applied to any proposed market:

Dimension	Score (L/M/H)	Notes
Regulatory risk		Cite specific applicable regulations
Wisdom-of-crowds value		Assess all 4 criteria
Estimated volume		Cite reference market and cannibalization qualifier
Implementation effort		Identify resolution source and infrastructure needs
Resolution source quality		Assess authority, ambiguity, timeliness, revision risk
Audience expansion		New users, adjacent users, or existing users?

4.4 The Concentrate-or-Expand Decision

Before creating a new market, the rubric should include one additional check: would the platform be better served by creating a new market, or by redesigning an existing one?

The midterm elections provide the clearest example. Polymarket has 435 individual House race markets, each generating $0-6K. The format fragments liquidity below the threshold where meaningful price discovery occurs. The solution is not 436 markets; it is a single ‘net seats gained or lost’ market that concentrates attention.

Decision rule: If the proposed market addresses the same question as 5+ existing thin markets (<$10K volume each), evaluate whether a single aggregated market would generate more total

volume and more useful information. If yes, create the aggregate and consider consolidating the thin markets.

5. Component 3: Signal Detection Layer

5.1 Purpose

The Signal Detection Layer surfaces expansion opportunities that are not on the Coverage Calendar—either because they are event-driven, demand-driven, or competitor-driven. This is the monitoring component, structured around specific signal types rather than generic media monitoring.

Design principle: Signal detection should be optimized for specificity, not sensitivity. The goal is not to detect every trending topic but to detect topics that (a) involve a binary outcome, (b) feature genuine uncertainty, (c) will sustain interest for 48+ hours, and (d) have a clean resolution source.

5.2 Signal Category 1: Internal Platform Signals

Source: Polymarket's own search queries, page view analytics, user-submitted market requests, and deposit/withdrawal patterns.

Why this matters: Internal data is the highest-signal, lowest-noise source because it reflects revealed demand from existing users.

- **Search queries without matching markets.** If 500 users search for 'bird flu' and there is no H5N1 market, that is a direct demand signal.
- **Page view to volume ratio.** A market with 10,000 views and $500 in volume is attracting curiosity but not trading—possibly a design problem.
- **User-submitted market requests.** Aggregate by theme to identify sustained demand patterns rather than reacting to individual requests.
- **Deposit patterns by category.** Shifts in deposit demographics signal changing platform composition and may indicate underserved segments.

5.3 Signal Category 2: Financial Market Signals

Source: Options markets, futures curves, volatility indices (VIX, MOVE), CDS spreads, and sector ETF flows.

Why this matters: Unusual financial market activity often indicates uncertain binary outcomes that prediction markets can address.

- **Options implied volatility spikes.** A biotech company's IV spiking to 200%+ ahead of a PDUFA date confirms genuine uncertainty—ideal for a prediction market.
- **VIX/MOVE index spikes.** Broad volatility spikes correlate with geopolitical or policy uncertainty where prediction markets can isolate specific binary outcomes.

- **CDS spread movements.** Sovereign CDS widening can signal political instability or default risk—fertile ground for prediction markets.

5.4 Signal Category 3: Cross-Market Price Signals

Source: Price movements in existing Polymarket markets that imply demand for derivative or adjacent markets.

Why this matters: This is a signal source unique to Polymarket. When the presidential nominee market moves 10% on VP selection rumors, that is a price-driven signal that a VP market should exist. When the shutdown market spikes, debt ceiling markets become relevant.

- **Causal drivers of large price movements.** When a major market moves 5%+, identify the catalyst. If the catalyst is a related event without its own market, evaluate creating one.
- **Comment section analysis.** Users frequently discuss related outcomes they wish they could trade. These are structured demand signals.
- **Correlation between markets.** If two markets consistently move together, investigate whether a third market isolating the common driver would attract its own volume.

5.5 Signal Category 4: Competitor Intelligence

Source: Market listings and volume data from Kalshi, Metaculus, Manifold Markets, and traditional sportsbooks (FanDuel, DraftKings, BetMGM).

Why this matters: Competitor data represents market-validated demand. If Kalshi launches a PDUFA market generating $500K in week one, that is direct evidence Polymarket should offer the same.

- **New market categories on Kalshi.** Kalshi already has a dedicated SCOTUS & Courts category and weather derivatives. New category launches indicate market-validated demand.
- **Volume leaders on Kalshi.** Highest-volume markets reveal topics generating sustained trading interest beyond Polymarket's existing coverage.
- **Metaculus/Manifold popular questions.** Questions attracting 1,000+ predictions indicate topics with genuine forecasting demand.
- **Sportsbook line availability.** If FanDuel offers NHL game lines and Polymarket doesn't carry NHL, sportsbook handle data quantifies the volume being left on the table.

5.6 Signal Category 5: Legislative and Regulatory Signals

Source: Congress.gov bill tracker, Federal Register filings, CFTC/SEC/FDA dockets, state legislative trackers.

Why this matters: Legislative actions are among the cleanest prediction market candidates: binary outcomes, official resolution sources, and known timelines.

- **Bills moving from committee to floor.** This stage transition is the appropriate trigger to evaluate a market.
- **Regulatory comment period openings.** When the CFTC opens an ANPRM with a 45-day comment period, the outcome is uncertain and consequential.
- **Judicial calendar events.** Oral arguments at SCOTUS signal that a ruling is forthcoming. The window between argument and opinion is the ideal trading period.

5.7 Signal Category 6: Media Intensity Signals

Source: Major news outlets, editorial boards, wire services (AP, Reuters), Google Trends.

Why this matters: Sustained media coverage of an uncertain outcome is a proxy for public attention—the raw fuel of prediction market volume.

Specificity filter: A topic is a good signal when three conditions are met simultaneously: (1) coverage spans 3+ days across multiple outlets, (2) editorial disagreement exists about the outcome, and (3) a clean binary framing is possible. Topics meeting (1) and (2) but not (3) are interesting narratives, not prediction market candidates.

5.8 Signal Category 7: Domain Community Signals

Source: Category-specific expert communities, forums, and professional networks.

Why this matters: Different categories have fundamentally different expert communities. Political opportunities surface among consultants on X. Biotech opportunities surface in PDUFA tracking communities. Sports opportunities surface among sharp bettors.

Category	Expert Communities	Signal Type
Politics/Elections	Political consultants on X, campaign finance trackers	Whip count shifts, internal polling, endorsement patterns
Biotech/FDA	BioPharmaChat, r/biotech, PDUFA.bio, ClinicalTrials.gov	Safety signals, ADCOMM panel composition, reviewer history
Sports	Sharp bettor accounts, analytics blogs, injury specialists	Line movements, injury intel, roster transactions
Crypto	CT (crypto Twitter), Telegram alpha groups, on-chain analysts	Token launches, governance proposals, protocol upgrades
Legal/SCOTUS	SCOTUSblog, legal scholars on X, law review feeds	Oral argument analysis, cert grants, conference list signals
Macro/Economy	Fed watchers, sell-side research, FOMC minutes analysis	Dot plot shifts, regional Fed speeches, data revisions

6. Component 4: Rapid Response Protocol

6.1 Purpose

The Rapid Response Protocol is a lightweight decision tree for breaking events that require same-day or same-hour market creation. Unlike the Coverage Calendar (months ahead) and Signal Detection Layer (days), this handles events where speed is the competitive advantage.

Polymarket's track record demonstrates strong rapid-response capability—Iran strike markets, emergency shutdown markets, and surprise political developments have all appeared quickly after events broke. The purpose of formalizing a protocol is to provide a consistent, repeatable decision framework that any team member can apply under time pressure, ensuring that the quality of rapid-response markets remains high as the volume and variety of events increases.

6.2 The Four-Gate Decision Tree

A breaking event should pass through four gates before a market is created. All four must be satisfied:

1. **Binary outcome?** Can the event be framed as yes/no with exactly two possible outcomes?
2. **Genuine uncertainty?** Is the outcome truly uncertain right now? If reporting has already established the outcome, a post-hoc market serves no purpose.
3. **Sustained interest?** Will the topic sustain interest for at least 48 hours? One-day stories generate thin markets that peak at $5-10K and die. When in doubt, err toward creation.
4. **Clean resolution?** Can the market be resolved using a single, authoritative source available within a reasonable timeframe? If unclear, route through the full Evaluation Rubric.

6.3 Resolution Speed Classes

Speed Class	Response Time	Event Types	Example
Immediate (<2 hrs)	Within 2 hours	Military actions, major political surprises, natural disasters	Iran strike, SCOTUS emergency ruling, major earthquake
Same-day (<12 hrs)	Within 12 hours	Legislative developments, diplomatic events, corporate announcements	Shutdown begins, surprise resignation, major acquisition
Next-day (<24 hrs)	Within 24 hours	Sustained crises, multi-day events, follow-on markets	Hurricane approaching landfall, diplomatic crisis, trial verdict watch

6.4 Post-Creation Review

Markets created under the Rapid Response Protocol bypass the full Evaluation Rubric in the interest of speed. To compensate, every rapid-response market should undergo a 24-hour post-creation review:

- **Resolution criteria review:** Is the resolution language precise enough? Are edge cases addressed?
- **Derivative assessment:** Does this event warrant additional markets (duration, magnitude, follow-on actions)?
- **Rubric scoring:** Retroactively score the market on all 6 dimensions. This creates a feedback loop that improves future decisions.

7. Bringing It Together

7.1 How the Components Interact

- **Coverage Calendar** surfaces known future events and schedules market creation in advance.
- **Signal Detection Layer** surfaces opportunities not on the calendar: emerging trends, unmet demand, competitor moves, derivative opportunities.
- **Evaluation Rubric** scores all candidates from both sources on six standardized dimensions.
- **Rapid Response Protocol** handles breaking events with a four-gate decision tree and post-creation review loop.

7.2 Expected Impact

Based on the companion Gap Analysis and Assessment Matrix, implementing this framework would capture the following opportunity set:

Opportunity Type	Source Component	Est. Annual Volume	Time Horizon
Political derivatives (VP, primaries, midterms, legislation)	Coverage Calendar + Rubric	$185-395M	Immediate
Health & Biotech (PDUFA, ADCOMM, Phase 3)	Coverage Calendar + Rubric	$50-150M/yr	6-12 months
Defensible sports (win totals, awards, season props)	Coverage Calendar + Competitor Intel	$70-160M/yr	Near-term
Structural nav changes (Courts, Housing promotion)	Internal Platform Signals + Rubric	Multiplicative	Immediate
Reactive event markets (geopolitical, crisis, breaking)	Signal Detection + Rapid Response	Variable ($10-50M+/event)	Ongoing

7.3 What This Framework Does Not Do

This framework is a process for identifying and evaluating market expansion opportunities. It is not a substitute for the legal, compliance, and regulatory analysis required before listing specific contracts. Each market that passes the Evaluation Rubric still requires review against applicable CFTC regulations, state-level gambling laws, and Polymarket’s internal compliance policies.

The framework also does not address market design (bracket sizing, tick increments, resolution timing, liquidity seeding strategies) or market lifecycle management (when to close a market, how to handle disputed resolutions, when to create successor markets). These are important operational questions that deserve their own analysis.

8. Conclusion

The Market Intelligence and Expansion Framework proposes a systematic process for identifying three categories of opportunity that are easy to overlook even on a platform as comprehensive as Polymarket: structural derivatives of existing high-volume markets (such as VP nominee markets alongside $1.38B+ in presidential nominee trading), calendar-driven events that recur on known schedules across multiple domains (40+ PDUFA dates per year, 8 FOMC meetings, 60 SCOTUS cases per term), and liquidity concentration opportunities where fewer, better-designed markets may outperform a larger number of thinly traded ones.

The framework addresses these opportunities with four components. The Coverage Calendar creates a forward-looking schedule of known-date binary events across all categories, ensuring that recurring opportunities are harvested systematically rather than noticed incidentally. The Signal Detection Layer monitors seven structured signal sources—from internal platform data and cross-market price movements to competitor intelligence and domain expert communities—to surface emerging opportunities that no calendar can predict. The Evaluation Rubric scores every candidate on six dimensions, including two (resolution source quality and audience expansion potential) that were identified during second-pass review as absent from the initial Assessment Matrix. The Rapid Response Protocol provides a lightweight four-gate decision tree for breaking events, with a post-creation review loop that feeds learning back into the rubric.

Applied to the opportunity set identified in the companion research, this framework would systematically capture **$185-395M in political derivatives, $50-150M/year in a genuinely new Health & Biotech category, and $70-160M/year in defensible sports formats**. Beyond these quantified opportunities, the Signal Detection Layer and Rapid Response Protocol ensure that the framework remains adaptive to the unpredictable events—geopolitical crises, surprise policy shifts, cultural moments—that have historically driven some of Polymarket’s highest-engagement markets. The goal is not to replace judgment with process, but to ensure that the process consistently surfaces the opportunities that judgment can then act on.
